the polypeptide as well as for studying modulators of the polypeptides.

(1) induces the proliferation of neural cells and regeneration of nerve and brain tissue and is useful for the treatment of central and peripheral nervous system diseases and neuropathies, such as Alzhelmer's, peripheral nervous system diseases and neuropathies, such as Alzhelmer's, certivity, regulation of haematopoiesis and is useful for treating myeloid or lymphoid cell disorders, platelet disorders such as thrombocytopenia and for regeneration of bone, cartilage, tendon, ligament and/or nerve tissue growth, and in tissue repair, healing of burns, incisions, culers, for treating osteoporosis, osteoarthritis, bone degenerative disorders, or periodontal disease. Furthermore, (1) is also useful for culers, for treating osteoporosis, osteoarthritis, bone degenerative culers, for periodontal disease. Furthermore, (1) is also useful for disorders including severe combined immunodeficiency (SCID), bacterial or reperfusion injury in various tissues, various immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or reperfusion, autoinmune disorders e.g. multiple sciencies and cingal infections, autoinmune disorders e.g. multiple sciencies and conditions, such as asthma or other respiratory problems. The authorities of the interval or circadian cycles of inhythms, cfertility, metabolism, catabolism, storage or elimination of dietary fat, lipid, protein, carbohydrate, vitamins, minerals, provides analgesic effects or other pain reducing effects immunoglobulian like care cannosition to a activity and can act as an antigen in a vaccine composition to raise an immune response. AAU28020-AAU28395 represent novel human secreted protein composition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 In vitro expansion of mammalian stem or progenitor cells, useful for producing cells that retain their pluripotential phenotype after expansion for use in transplantation, involves increasing the levels of beta-catenin in the cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; stem cell culturing; progenitor cell; pluripotential phenotype; transplantation; haematopoletic function; allogeneic recipient; signalling pathway; beta-catenin.

The present invention relates to a method for in vitro expansion of mammalian stem, or progenitor cells, which comprising increasing the intracellular concentration of beta-catenin in a progenitor or stem cell concentration of period sufficient for the progenitor or istem cell to divide. The number of cells having the functional or stem cell to divide. The number of cells is expanded. The method is phenotype of the stem or progenitor cells is expanded. The method is useful for culturing stem cells and progenitor cells, which retain their pluripotential phenotype after expansion, in vitro. The expanded cell pullipotential phenotype after expansion, in vitro. The expanded cell countrion in a host that is deficient in a particular cell lineage or lineages. The expanded cell populations are also useful in transplantation to restore haematopoletic function to autobogous or alloquence recipients. The present sequence is human beta catenin protein. Beta-catenin is a pivotal player in the signalling pathway in interest.
                                                                                                                                                                                                                                                                                                                                                                                                                               ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for in vitro expansion of mammalian stem or progenitor cells, which comprising increasing the intracellular concentration of beta-catenin in a progenitor or stem cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of

                                                        which retain their
               or stem cell to divide. The number of cells having the functional phenotype of the stem or progenitor cells is expanded. The method is useful for culturing stem cells and progenitor cells, which retain their pluripotential phenotype after expansion, in vitro. The expanded cell populations are useful as a source of stem cells, e.g. to reconstitute function in a host that is deficient in a particular cell lineage or lineages. The expanded cell populations are also useful in alogened cell populations are also useful in alogened certore haematopoietic function to autologous or allogened recipients. The present sequence is mouse beta-catenin protein. Beta-catenin is a pivotal player in the signalling pathway initiated by Wnt proteins, which are mediators of several developmental
 an in vitro culture medium for a period sufficient for the progenitor

Signamia Trepstrusion injury, snock, sepsis, immune responses, and is involved in increasing haematopolasis, stem cell survival, bone growth and remodeling: (1); (11) and modulators of (11) are useful for and remodeling: (1); (11) and modulators of (11) are useful for creating transgenic animals useful for studying the in vivo activities of the polypeptide as well as for studying modulators of the polypeptides. (C. C. print) and responses of the polypeptides of the proliferation of neural cells and responseration of nerve and brain tissue and is useful for the treatment of central and nerves system diseases and neuropathies, such as Alzhelmer's, pertipheral nervous system diseases and neuropathies, such as Alzhelmer's, perkinson's disease, Huntington's disease, and amyotrophic lateral corparition of haematopolesis and is useful for treating myeloid cell disorders, platelet disorders such as thrombocytopenia and for respension of hone, cartilage, tendon, ligament and/or nerve tissue growth, and in tissue repair, healing of burns, incisions, incisions, the disorders for treating osteoporosis, osteoarthritis, bone degenerative disorders, or periodontal disease. Furthermore, (1) is also useful for respension injury in various tissues, various immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or fungal infections, autoimment disorders e.g. multiple sclerosis, creations and conditions, such as asthma or other respiratory problems. C. In addition, (1) affects biorhythms or circadae and gravis, allergic effects or other as asthma or other respiratory problems. C. In addition, (1) affects biorhythms or circadae or elimination or alse an anique of analgasic effects or other pain reducing effects, immunoglobulin like activity and can antigen in a vaccine composition to raise an anique manner or activity and each archaen an anique manner as an anique manner and proper processed the payment of the property of the processed the payment of the processed and payment of the processed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ij
                                          The invention relates to novel isolated human secreted polypeptides (I) angirphyncleotides (II). (I) and (II) are useful for treating inflammatory conditions such as arthritis, nephritis, Crohn's disease, ischemmia-reperfusion.injury, shock, sepsis, immune responses, and is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Drosophila; developmental biology; cell signalling; insecticide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1;

New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention isseful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                        The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                        New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Drosophila; developmental biology; cell signalling; insecticide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NO 24249; 21pp + Sequence Listing; English

```
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                     1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (ABB57737-ABB72072). This patent did not form part of the printed The sequence data for this patent did not format directly from WIPO specification, but was obtained in electronic format directly from WIPO at frow wipo.int/pub/published_pct_sequences.
                                                                                                                              The Sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         detection reagent for detecting 1000 or more for elucidating cell signalling and cell-cell
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and insecticides, theractions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA.sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Drosophila; developmental biology; cell signalling; insecticide;

Agents for treating human diseases, particularly cancer, modulate interaction of beta catenin with transcription factors or tumor suppressor gene products

Disclosure; Page 7; 16pp; German.

Example 4; Fig 5; 16pp; German.

suppressor gene products

This invention describes a novel agent (A) for treating human disease which is based on substances (I) that modulate (inhibit or promote) the interaction of beta-catenin with transcription factors or products of tumor suppressor genes. The invention also describes (a) peptides of tumor suppressor genes. The invention also describes (a) peptides (II) compressor genes. The invention also describes (a) peptides (II) trom the armadillo domain (arm units 3-8) of beta-cated molecules (III) from the complete beta-catenin molecule, that include at least one of the specific interaction domains for LEF-1, TCF-4, APC, conductin or specific interaction domains for LEF-1, TCF-4, APC, conductin or screening substance libraries for compounds that modulate interaction of beta-catenin with LEF-1/TCF, APC, conductin or E-cadherin. Beta-catenin development of tumors. Generally its interaction with LEF-1 or TCF-4 is oncogenic but interaction with APC, conductin or E-cadherin is concept to the conductin or E-cadherin is concept to the conductin or E-cadherin is concept to the conduction are particularly used to the conduction are particularly to the conduction are particularly are conduction are particularly treat tumors, especially carcinoma of the colon and melanoma, but also, where they promote interaction, to stimulate regeneration of organs and tissues, specifically hair growth. AAY33217-Y33222 represent human beta-catenin armadillo repeat fragments described in the method of the invention

This invention describes a novel agent (A) for treating human disease which is based on substances (I) that modulate (inhibit or promote) the interaction of beta-catenin with transcription factors or products of tumor suppressor genes. The invention also describes (a) peptides of comprising part of the LEF-1/TCF-4 transcription factors, or their variants and mutants; (b) peptides and related molecules (III) from the complete beta-catenin molecule, that include at least one of the specific interaction domains for LEF-1, TCF-4, APC, conductin or specific interaction domains for LEF-1, TCF-4, APC, conductin or screening substance libraries for compounds that modulate interaction of beta-catenin with LEF-1/TCF, APC, conductin or E-cadherin. Beta-catenin is a key compound in the Wht signalling pathway and is involved in a key compound in the Wht signalling pathway and is involved in oncogenic but interaction with LEF-1 or TCF-4 is oncogenic but interaction with APC, conductin or E-cadherin is anti-oncogenic. (A) which inhibit interaction are particularly used to treat tumors, especially carcinoma of the colon and melanoma, but also, where they promote interaction, to stimulate regeneration of organs and tissues, specifically hair growth, AAV33230 v33241 represent mutant human beta-catenin armadillo repeat fragments described in the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is that of protein P14-2f encoded by an open reading frame identified in cosmid CHRIM5 (see AAA50029). CHRIM5 was obtained by ligating Xenorhabdus bovienii strain 173 (NCIMB 40986). Sau3A-digested DNA fragments into the BamH1 site of the Stratagene cosmid vector Supercos1, packaging into Escherichia coli XL Blue 1, and screening for nematocidal activity against Caenorhabdits elegans. Analysis of the DNA indicated a number of open reading frames for which the corresponding protein sequences were determined (see AAY95685-Y95735). Nematodes can be controlled through the use of bacteria associated symbiotically with an entomopathogenic nematode. Such bacteria include Xenorhabdus and Photorhabdus spp. such as X. bovienii strain 173. The symbiont bacteria, an engineered bacterium, or a nematocidal protein obtained from such bacteria. Particularly P13-1f (see AAY95706) or P14-2f can be used to control the plant protein or domesticated animal or for the control

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fig. wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher evexyotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL30511), expressed DNA (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

US-08-982-785A-2
Sequence 2, Application US/08982785A
Patent No. 6258929
GENERAL INFORMATION:
APPLICANT: Rosik, Kenneth S.
APPLICANT: Zhou, Jianhua
TITLE OF INVENTION: ALARM RELATED PEPTIDES AND
TITLE OF INVENTION: NUCLEIC ACIDS AND DIAGNOSIS USING THEM
NUMBER OF SEQUENCES: 13
CORRESPONDENCE ADDRESS:
ADDRESSEE: Fish & Richardson P.C.
                                                                                                                                                                                                                                                                                                                                             APPLICANT: KOSIK, Kenneth S.

A; Title: Identification of a Hydra homologue of the beta-catenin/plakoglobin/armadillo
A; Reference number: JC4835; MUID:96257271
A; Accession: JC4835
A; Status: nucleic acid sequence not shown
A; Molecule type: mRNA
A; Residues: 1-806 <HOB>

LEGURAL TRANSDÚCTION THROUGH THE WAT PATHWAY.

LEGURAL TRANSDÚCTION THROUGH THE WAT PATHWAY.

LEGURAL TRANSDÚCTION THROUGH THE WAT ALLOWS THE STIMULATION TO STUDIE FORM ALSO INTERACTS WITH APPC AND SECONDATION. THE CYTOSOLIC FORM ALSO INTERACTS WITH APPC AND SECONDATION. THE CYTOSOLIC FORM SINDS TCE/LEF.1 AND MAY ALSO BIND COMPINIS. AND DUPLIN. CAN HETERODIMERIZE WITH ALPHA-CATTENIN AND SECONDATION. CYTOPLEX WITH CADHERIN. MEDIATES THE ANCHORAGE OF PROSPHORYLATION). TRANSLOCATES TO THE NUCLEUS WHEN IT IS STABLILIZED, (LOW LEVEL OF PHOSPHORYLATION).

CHEVEL OF PHOSPHORYLATION). TRANSLOCATES TO THE NUCLEUS WHEN IT IS STABLILIZED, (LOW LEVEL OF PHOSPHORYLATION).

CHEVEL OF PROBABLY PHOSPHORYLATION).

CHEVEL OF DATAGONIZES THE ACTION OF GSK-3B. WINT-DEPENDENT ACTIVATION OF DATAGONIZES THE ACTION OF GSK-3B. WINT-DEPENDENT ACTIVATION OF DATAGONIZES THE ACTION OF GSK-3B. WINT-DEPENDENT ACTIVATION OF BEJA-CATENIN FAMILY.

CHEVEL OF DATAGONIZES THE ACTION OF GSK-3B. WINT-DEPENDENT ACTIVATION OF BEJA-CHERNIN SERIORES AND THE PROFILE IS NO LONGER DEGRADED,

RESULTING IN ITS ACCUMULATION IN CYTOPLASM.

CHEVEL OF DATAGONIZES THE ACTION OF GSK-3B. WINT-BEPRADES.

RESULTING IN ITS ACCUMULATION IN CYTOPLASM.

CHEVEL OF DATAGONIZES THE ACTION OF GSK-3B. WINT-BERGRADED,

RESULTING IN ITS ACCUMULATION IN CYTOPLASM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

-!- FUNCTION: INVOLVED IN THE REGULATION OF CELL ADHESION AND IN SIGNAL TRANSDUCTION THROUGH THE WIT PATHWAX (BY SIMILARITY).

-!- SUBUNIT: THE CYTOSOLIC FORM BOUND TO AXIN ALLOWS THE STIMULATION OF ITS DEGRADATION. THE CYTOSOLIC FORM ALSO INTERACTS WITH APC AND B-CADHERIN. THE MUCLEAR FORM BINDS TCF/LEF-1 AND MAY ALSO BIND PONTINS2 AND DUPLIN. CAN HETERODIMERIZE WITH ALPHA-CATENIN AND ALSO FORM A TRIMBRIC COMPLEX WITH CADHERIN. MEDIATES THE ANCHORGE OF THE CADHERIN. MEDIATES THE ANCHORGE OF THE CADHERIN. MEDIATES THE ANCHORGE
                                                                                                                                                                                                      MEDLINE-99428593; PubMed-10497305; Chung S.S.W., Lee W.M., Cheng C.Y.; Study on the formation of specialized inter-Sertoli cell junctions in vitro.";
                                                                                                                                                                                                                                                                                                                                                                                                                                      SUBCELLULAR LOCATION: CYTOPLASMIC WHEN IT IS UNSTABILIZED (HIGH LEVEL OF PHOSPHORYLATION). TRANSLOCATES TO THE NUCLEUS WHEN IT IS TABILIZED (LOW LEVEL OF PHOSPHORYLATION) (BY SIMILARITY).

TISSUE SPECIFICITY: EXPRESSED IN THE TESTIS.

DEVELOPMENTAL STAGE: HIGHLY EXPRESSED AT E30-60 DAY DPC IN THE TESTIS. REDUCED EXPRESSION AT E90 DAY DPC.

PTW. PROBABLY PHOSPHORYLATED BY GSK-3B. WNT-DEPENDENT ACTIVATION OF DVL ANTAGONIZES THE ACTION OF GSK-3B. PHOSPHORYLATION OF BETA-CATENIX IS REDUCED AND THE PROTEIN IS NO LONGER DEGRADED,

REGULTING IN ITS ACCUMULATION IN CYTOPLASM (BY SIMILARITY).

SIMILARITY: CONTAINS 12 ARM REPEATS.
                                                                                   Rattus norvegicus (Rat).

- FINCTION: BINDS TO THE CYTOPLASMIC DOMAIN OF THE CELL-CELL
- ADHESION MOLECULE E-CADHERIN, AND PERHAPS TO OTHER (MEMBRANE)
- PROTEINS. THE ASSOCIATION OF CATEXINS TO CAPHERINS PRODUCES A
COMPLEX WHICH IS LINKED TO THE ACTIN FILAMENT NETWORK, AND WHICH
SERMS TO BE OF PRIMARY IMPORTANCE FOR CADHERINS CELL-ADHESION
PROPERTIES. ESSENTIAL COMPONENT OF THE VERTEBRATE WAT SIGNALING
- PATHWAY AND IS REQUIRED FOR FORMATION OF THE EMBRYONIC AXIS.
- SIMILARITY: CONTAINS 10 ARM REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

-1- FUNCTION: BINDS TO THE CYTOPLASMIC DOWAIN OF THE CELL-CELL ADHESION MOLECULE E-CADHERIN, AND PERHAPS TO CYHER (MEMBRANE) PROTEINS. THE ASSOCIATION OF CAFFININS TO CADHERINS PRODUCES A COMPLEX WHICH IS LINED TO THE ACTIN FILAMENT NETWORK, AND WHICH SEEMS TO BE OF PRIMARY IMPORTANCE FOR CADHERINS CELL-ADHESION
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

THE PRESENCE OF PLAKOGLOBIN IN BOTH THE DESMOSOMES AND IN THE INTERNEDIATE JUNCTIONS SUGGESTS THAT IT PLAYS A CENTRAL ROLE IN THE STRUCTURE AND FUNCTION OF SUBMEMBRANOUS PLAQUES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

M. Sequence and analysis of chromosome l of the plant Arabidopsis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Hagnoliophyta; eudicotyledons; core eudicots; Rosidae; eurosids II; Brassicales; Brassicaceae; Arabidopsis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -1- FUNCTION: COMPONENT OF THE ORIGIN RECOGNITION COMPLEX (ORC) THAT BINDS ORIGINS OF REPLICATION. IT HAS A ROLE IN BOTH CHROMOSOMAL. REPLICATION AND MATING TYPE TRANSCRIPTIONAL SILENCING. BINDS TO THE ARS CONSENSUS SEGUENCE (ACS) OF ORIGINS OF REPLICATION IN AN ATP-DEPENDENT MANNER (BY SIMILARITY).
--- SUBDUNT: ORC IS COMPOSED OF SIX SUBDUNTS (BY SIMILARITY).
--- SUBCELLULAR LOCATION: NUCLEAR (BY SIMILARITY).
                                                                                                                                                                                                                                                 Gaps

Agents for treating human diseases, particularly cancer, modulate interaction of beta-catenin with transcription factors or tumor

```
This invention describes a novel agent (A) for treating human disease which is based on substances (I) that modulate (inhibit or promote) the interaction of beta-catenin with transcription factors or products of tumor suppressor genes. The invention also describes (a) peptides (II) comprising part of the LEF-1/TCF-4 transcription factors, or their variants and mutants; (b) peptides and related molecules (III) from the armadillo domain (arm units 3-8) of beta-catenin, and mutants of the complete beta-catenin molecule, that include at least one of the specific interaction domains for LEF-1, TCF-4, APC, conductin or E-cadherin; and (C) enzyme-linked immunosorbent assay (ELISA) for screening substance libraries for compounds that modulate interaction of beta-catenin with LEF-1/TCF, APC, conductin or E-cadherin. Beta-catenin is a key compound in the Wht signalling pathway and is involved in development of tumors. Generally its interaction with LEF-1 or TCF-4 is oncogenic but interaction with APC, conductin or E-cadherin is anti-oncogenic. (A) which inhibit interaction are particularly used to treat tumors, specifically carcinoma of the colon and melanoma, but also, where they promote interaction, to simulate regeneration of organs and issues, specifically hair growth. AAY33217-Y33222 represent human beta-catenin armadillo repeat fragments described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense compounds targeting nucleic acids encoding human beta catenin (HBC) useful for treating diseases associated with HBC expression and as prophylaxis to prevent or delay infection, inflammation or tumor formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Beta catenin; cadherin; metastasis; cadherin-associated protein; human; colorectal cancer; melanoma; antisense oligonucleotide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Length 43;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, beta-catenin; Wnt antagonist; contraceptive; contraceptive vaccine; oocyte development; female primate contraception; oocyte viability; monoclonal antibody; Wnt signalling.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The patent discloses a method of female primate contraception comprising administering an antagonist of a wnt polypeptide, inhibiting occyte development. Wnt polypeptides are useful for promotive maturation of an immature occyte. Wn polypeptides are also useful for increasing the number of mature occytes and to enhance occyte viability. Soluble fragments of wnt polypeptides have the ability to inhibit wnt signalling, e.g., by blocking binding of a naturally-occurring wnt protein to its receptor. They may be used to generate monoclonal antibodies which can inhibit occyte development. The present sequence is the human beta-catenin protein. Dominant negative mutants of beta-catenin lack one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Contraceptive composition for inhibiting oocyte development in a female primate comprises a wnt polypeptide antagonist

(I), (II) and modulators of (II) are useful for prophylaxis or treatment of one or more cancers. (II) is also useful for creating transgenic animals useful for studying the in vivo activities of

the polypeptide as well as for studying modulators of the polypeptides.

(1) induces the proliferation of neural cells and regeneration of nerve and brain tissue and is useful for the treatment of central and peripheral nervous system diseases and neuropathies, such as Alzheimer's, certification's disease, Huntington's disease, and amyotrophic lateral solerosis. In addition, (I) is involved in chemotactic or chemokinetic activity, regulation of haematopolesis and is useful for treating myeloid or lissue growth, and in tissue repair, healing of burns, inclisions, or itsue growth, and in tissue repair, healing of burns, inclisions, of treating osteoporosis, osteoarthritis, bone degenerative disorders, or periodontal disease. Furthermore, (I) is also useful for cepertusion injury in various tissues, various immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or fungal infections; autoimmune disorders e.g. multiple sclerosis, reactions; autoimmune disorders e.g. multiple sclerosis, reactions and conditions, such as asthma or other respiratory problems. In about the conditions, such as asthma or other respiratory problems. In about the conditions, such as asthma or other respiratory problems.

beta-catenin in the cell

us-09-641-104a-8.rag

7 %

```
mammalian stem or progenitor cells, which comprising increasing the mammalian stem or progenitor cells, which comprising increasing the intracellular concentration of beta-catenin in a progenitor or stem cell in an in vitro culture medium for a period sufficient for the progenitor or stem cell to divide. The number of cells having the functional penotype of the stem or progenitor cells is expanded. The method is useful for culturing stem cells and progenitor cells, which retain their pluripotential phenotype after expansion, in vitro. The expanded cell populations are useful as a source of stem cells, e.g. to reconstitute function in a host that is deficient in a particular cell lineage or lineages. The expanded cell populations are also useful in transplantation to restore haematopoietic function to autologous or allocation. Beta-catenin is a pivotal player in the signalling pathway in this protein. Beta-catenin is a pivotal player in the signalling pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for in vitro expansion of mammalian stem or progenitor cells, which comprising increasing the intracellular concentration of beta-catenin in a progenitor or stem cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mouse; stem cell culturing; progenitor cell; pluripotential phenotype; transplantation; haematopoletic function; allogeneic recipient; signalling pathway; beta-catenin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  In vitro expansion of mammalian stem or progenitor cells, useful for producing 'cells that retain their pluripotential phenotype after expansion for use in transplantation, involves increasing the levels beta-catenin in the cell .
                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                    oristin vitro culture medium for a period sufficient for the progenitor oristen cell to divide. The number of cells having the functional phenotype of the stem or progenitor cells is expanded. The method is useful for culturing stem cells and progenitor cells, which retain their plutipotential phenotype after expansion, in vitro. The expanded cell populations are useful as a source of stem cells, e.g. to reconstitute function in a host that is deficient in a particular cell lineage or lineages. The expanded cell populations are also useful in transplantation to restore haematopoietic function to autologous or allogeneic recipients. The present sequence is mouse beta-catenin protein, as a pivotal player in the signalling pathway initiated by wit proteins, which are mediators of several developmental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Zhou P;

intransmentory contituency, shock, sepsis, immune responses, and is involved in increasing haematopoiesis, stem cell survival, bone growth and remodeling (1), (11) and modulators of (11) are useful for prophylaxis or treatment of one or more cancers. (II) is also useful for creating transgenic animals useful for studying the in vivo activities of the polypeptides. (I) induces the proliferation of neural cells and regeneration of neural cells and regeneration of nerve partinson's disease, Huntington's disease, and amyotrophic lateral cells in addition, (I) is involved in chemotactic or chemokinetic cells. In addition, (I) is involved in chemotactic or chemokinetic cells. In addition, (I) is involved in chemotactic or chemokinetic cells. In addition, (I) is involved in chemotactic or chemokinetic or lymphoid cell disorders, platelet disorders such as thrombocytopenia to Insue growth, and in tissue repair, healing of burns, incisions, culcers, for treating osteoporosis, osteoarthitis, bone degenerative cell disorders, or periodontal disease. Furthermore, (I) is also useful for continuous and treatment of lung or liver fibrosis, or moreful.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        reperfusion injury in various tissues, various immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or fungal infections, autoimmune disorders e.g. multiple sclerosis, rhemmatoid arthritis, diabetes mellitus, myasthenia gravis, allergic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               reactions and conditions, such as asthma or other respiratory problems. In addition, (I) affects blorhythms or circadian cycles of rhythms, fertility, metabolism, catabolism, anabolism, storage or elimination of dietary fat, lipid, protein, carbohydrate, vitamins, minerals, provides analgesic effects or other pain reducing effects, immunoglobulin like activity and can act as an antigen in a vaccine composition to raise an immune response. AAU28020-AAU28395 represent novel human secreted protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    modulator; interaction domain; transcription factor; TCF-4; oncogenic; tumor suppressor gene; conductin; E-cadherin; screening; carcinoma; APC; Wnt signalling pathway; tumor development; anti-oncogenic; melanoma; organ regeneration; tissue regeneration; hair growth; mutant.
                                             invention relates to novel isolated human secreted polypeptides (I) polynucleotides (II). (I) and (II) are useful for treating lammatory conditions such as arthritis, nephritis, Crohn's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Beta-catenin; human; armadillo repeat; treatment; human disease; LEF-1;

This invention describes a novel agent (A) for treating human disease which is based on substances (I) that modulate (inhibit or promote) the interaction of beta-catenin with transcription factors or products of tunor suppressor genes. The invention also describes (a) peptides (II) comprising part of the LEF-1/TCF-4 transcription factors, or their variants and mutants; (b) peptides and related molecules (III) from the armadillo domain (arm units 3-8) of beta-catenin, and mutants of the complete beta-catenin molecule, that include at least one of the specific interaction domains for LEF-1, TCF-4, APC, conductin or E-cadherin; and (C) enzyme-linked immunosorbent assay (ELISA) for screening substance libraries for compounds that modulate interaction of beta-catenin with LEF-1/TCF, APC, conductin or E-cadherin beta-catenin (A) which interaction with LEF-1 or TCF-4 is development of tumors. Generally its interaction with LEF-1 or TCF-4 is ontogenic but interaction with APC, conductin or E-cadherin is anti-oncogenic (A) which inhibit interaction are particularly used to treat tumors, especially carcinoma of the colon and melanoma, but also, where they promote interaction, to stimulate ergemeration of organs and tissues, specifically half growth. AAY3330+Y33241 represent mutant the method of the colon and melanomy but also, the colon and elements described in the method of the colon and melanomy but also, the colon and melano

                                                                                                                                                  -S
                                                                                                                                                                                                                  (ABB57737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                 solated nucleic acid detection reagent for detecting 1000 or more from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL0156-ABL30511), expressed DNA sequences (ABL011676-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                13
                           1.8
(ABB57737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at (Itp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell. interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Drosophila; developmental biology; cell signalling; insecticide;
                                                                                                                                                                                                                                                                                                                                                                        ;

The ligand pref. contains only a single BS and has an amino acid sequence <100 (pref. <20) residues in length. The ligand may also comprise a plurality of fragment 389..394. A therapeutic compsn. contg. the polypeptide is used to stimulate or inhibit Blymphocyte proliferation in patients with B cell lymphoma. Blymphocytes and myeloma's can be stimulated in patients with immunodeficiencies and immunoglobulin secretion by hybridoma cultures can be boosted.

The compsn. can be administered to inhibit infection in vitro or in vivo by Epstein Barr Virus.
